THEXRA ENTERPRISE SOLUTION PROPOSAL

13-Section Formal AI Solution Brief

Date: 06/10/2026
Status: Proposal Template

1. Executive Summary

> *[Template Placeholder]: Executive summary pitch highlighting strategic impact, solution fit, and high-level ROI for Client.*

2. Client Challenge

Low visitor engagement and severe physical bottlenecking at historic UNESCO ruins caused by passive, static informational plaques that fail to distribute crowd flow or bring ancient structures to life.

3. Project Objective

> **Target KPIs:** Disperse foot traffic across ruins, boost visitor satisfaction and educational retention, and digitize historical storytelling without physically altering delicate heritage structures within 1-3 months.
>
> [Template Placeholder]: Primary business benchmarks, quantitative metrics, and adoption goals.

4. Proposed Solution

A mobile augmented reality spatial tour guide deployed via THEXRA View that overlays digital 3D historical reconstructions directly atop physical ruins using geolocation and markerless visual anchors, distributing visitor foot traffic with dynamic wayfinding.

IMPLEMENTATION PHASING:

1. Phase 1: Rapid 3D point-cloud surveying of priority ruins and historical asset digitization.
2. Phase 2: AR scene assembly, intelligent routing logic setup, and THEXRA View integration.
3. Phase 3: On-site spatial calibration, visitor stress-testing, and operational go-live.

5. User Experience & Journey

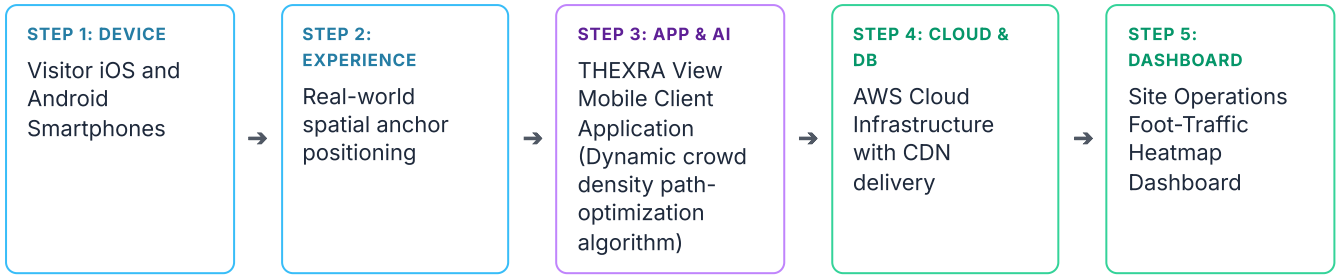

Target Users: Heritage tourists, cultural travelers, educational tour groups, and site park rangers.

Workflow: Visitor scans an entry QR code to launch THEXRA View → Device detects spatial location via GPS and camera → Interactive 3D reconstruction overlays onto physical ruins → Guided dynamic audio/visual prompts navigate visitor along balanced, low-density walking loops.

6. Solution Architecture

AR — THEXRA View

AUTOMATED SYSTEM FLOW DIAGRAM:

Hardware: Visitor iOS and Android Smartphones, Low-profile solar outdoor Bluetooth beacon nodes

Software: THEXRA View Mobile Client Application, THEXRA Spatial Localization Engine, Cloud Content Management Console

AI Components: Dynamic crowd density path-optimization algorithm, Automated multilingual audio narration translator

XR Components: Real-world spatial anchor positioning, Historical architectural 3D overlay rendering

Backend: AWS Cloud Infrastructure with CDN delivery, Spatial Anchor Coordinate Database (PostgreSQL)

Dashboard: Site Operations Foot-Traffic Heatmap Dashboard, AR Content Management and Story Editor Portal

Data Flow: Mobile Device Sensor/Camera → Spatial Positioning Engine → Cloud CMS → Dynamic 3D/Audio Display Stream

7. Scope of Work (SOW)

Project Scope: Delivery of an outdoor Augmented Reality visitor journey via THEXRA View covering up to 8 historic landmark zones within the UNESCO ruins to resolve plaque bottlenecks and modernize engagement.

Core Features: Markerless 3D historical overlays restoring ruined structures to original splendor, Real-time congestion-aware digital wayfinding paths, Bilingual spatial audio storytelling triggers, Staff analytics dashboard tracking visitor density heatmaps

Exclusions: Physical ground alterations or civil construction on UNESCO heritage land, Provision of dedicated rental smartphone hardware for public visitors, Original archival research or historical fact verification services

8. Deliverables

THEXRA View application site bundle • Configured Spatial CMS and operations dashboard • Site staff administration guide • Visitor digital onboarding media kit

9. Implementation Plan

1. **Discovery** (1 week):Site spatial audit report • Technical architecture and asset requirement specs
2. **Design** (1.5 weeks):Visitor journey UI flow • 3D architectural reconstruction storyboard
3. **Prototype** (1.5 weeks):Single-ruin functional AR prototype • Initial spatial tracking validation report
4. **Development** (3 weeks):Full landmark AR scene builds in THEXRA View • Foot-traffic dynamic rerouting engine
5. **Testing** (1.5 weeks):Outdoor environmental illumination QA • Multi-device performance and drift audit
6. **Deployment** (1.5 weeks):Public launch of THEXRA View experience • Live visitor analytics monitoring active
7. **Support** (Ongoing):Quarterly spatial anchor recalibration • Monthly visitor throughput and stability reports

10. Timeline & Delivery Target

Target Horizon: 1-3-months

Includes discovery, design, development, acceptance testing, and on-site rollout.

11. Assumptions & Prerequisites

> [Day 16 Template Placeholder]: Key prerequisite technical access, client data provisioning, site network availability, and team resources.

12. Optional Add-ons & Phase 2 Upsells

> **Alternative Option:** Combination solution — THEXRA Suite (Remote, Make, View)
>
> [Day 16 Template Placeholder]: Optional maintenance extensions, advanced analytics upgrades, or additional spatial licenses.

13. Next Steps & Scoping Workshop

Conduct a spatial LiDAR mapping scan of designated ruin landmarks and establish visitor dispersal route paths for prototype benchmarking.
